

Install on Windows

Generated on August 14, 2026

Download

Download the signed MSI installer (or the portable EXE, if you don't want a service) from the [download page](#). Verify the published SHA-256 checksum before running it.

Installing

1. Run the MSI. Windows may show a signed-publisher prompt — confirm it comes from Amtiri SpA.
2. The installer registers a Windows service named `DataOrchester` and starts it automatically.
3. It opens a firewall rule for the configured HTTP port so the web UI is reachable on the local network.

Verifying the installation

- Open `services.msc` and confirm `DataOrchester` shows as **Running**.
- Reboot the machine once and confirm the service starts automatically before any user logs in — the engine is meant to run headless, driving physical processes even when nobody is signed in.
- Browse to `http://localhost` (or the configured port) to reach the [first run](#) screen.

If SmartScreen warns

A correctly signed installer (Authenticode) should not trigger a SmartScreen warning. If you see one on a release that is supposed to be signed, do not proceed — verify the checksum again and contact support before installing.
