USER MANUAL

Getting started

Generated on November 14, 2026

These are the first steps once Data Orchester is installed and you can sign in. Installing it and the first sign-in are on the download page.

Minimum initial configuration

To get something running end to end:

1. Add your first **module** — the connection to a device: a Modbus master, an OPC UA client, a Siemens S7 client and the like, which reads the device's values and writes back to it.
2. Map what it reads and writes to **variables**, the values your program and dashboards work with.
3. Confirm data is flowing on a dashboard before building anything more elaborate.

A **peer** is another DataOrchester: add one when a second installation — a site and its control room — should exchange values, commands and history with this one. See Connectivity.
